

# Git Cheat Sheet

## Prepare to Commit

Add untracked file or unstaged changes: `git add file`

Add all untracked files and unstaged changes: `git add .`

Choose which parts of a file to stage: `git add -p`

## Discard Your Changes

Delete unstaged changes to one file: `git restore file`

Delete all staged and unstaged changes: `git reset hard`

## Code Archaeology

Look at a branch's history: `git log main`

Show who last changed each line of a file: `git blame file`

## Diff Staged and Unstaged Changes

Diff all staged and unstaged changes: `git diff HEAD`

Diff just staged changes: `git diff staged`

## Make Commits

Make a commit and open text editor to write message:  
`git commit`

Make a commit: `git commit -m message`

## Push Your Changes

Push the local branch to the remote: `git push origin main`

Force push: `git push force-with-lease`

## Pull Changes

Fetch changes but don't change any local branches: `git fetch origin main`

Fetch changes and then rebase your current branch:  
`git pull rebase`

## Restore an Old File

Get the version of a file from another commit: `git checkout commit file`

## Configure Git

Set a config option: `git config user.name Your Name`

Add an alias: `git config alias.st status`
